

Questions For Your Pediatrician

VACCINATIONS? *Assessing the Risks and Benefits*

The goal of this questionnaire is to empower parents to develop a more flexible and individualized relationship with their pediatrician.

With everything in the news and concerns from other parents I've spoken with, I'm concerned about vaccinations; whether they have side-effects, whether they contribute to autism or other development problems.

What does the complete AAP immunization schedule look like?

Do you think there are risks associated with any vaccinations?
If so, what are they?

Is it safe if we vaccinate later than the recommended schedule?

Is it safe if we spread out the vaccinations and not do several of them at the same time?

Which vaccinations do you think are more critical than others?

Which vaccinations more important now and which can be dealt with later?

What kind of preservatives are currently being used in vaccinations?

What are the potential side-effects of particular vaccinations?

What is an MMR? What is the DPT?

What do these Combos protect against?

Can these Combos be separated out?

Do you keep track of the Lot #'s and are you notified about recalls?

If we vary from the standard vaccination schedule, can my child still go to school? (see Dr. Jay's White Paper)
